

macOS installation

Use the package that matches your Mac processor.

Mac type	Installer
Apple silicon (M1 or newer)	nfit-0.88.4-macos-arm64.pkg
Intel processor	nfit-0.88.4-macos-x86_64.pkg

- 1 Open the private nfit repository's **Releases** page and download the correct **.pkg** file shown above. To check your processor, choose **Apple menu > About This Mac**.
- 2 Double-click the downloaded package to open Apple Installer.
- 3 If macOS blocks the unsigned beta package, try opening it once. Then open **System Settings > Privacy & Security**, scroll to Security, click **Open Anyway**, and confirm with your Mac login password.
- 4 Follow the Apple Installer prompts and wait for its progress bar to finish.
- 5 Open **nfit** from Applications or Launchpad. A branded splash screen appears while the scientific components load.

Requirements and offline use: GitHub repository read access is required to download a beta release. The installer includes Python 3.14 and the scientific libraries used by nfit; Python, Conda, and Git are not required. The bundled manual works without internet access.

Windows installation

For 64-bit Windows 10 or Windows 11 computers.

Download **nfit-0.88.4-windows-x86_64.exe** from the private repository's Releases page.

- 1 Double-click the downloaded **.exe** installer.
- 2 Because this beta is not yet signed, Microsoft Defender SmartScreen may show **Windows protected your PC**. Click **More info**, then click **Run anyway**.
- 3 Follow the nfit Setup wizard. You may select **Create a desktop shortcut** if desired.
- 4 Wait for the setup progress bar to finish, then close the wizard.
- 5 Open **nfit** from the Start menu or the desktop shortcut.

Managed computers: A workplace or university security policy may prevent unsigned applications from running. If Run anyway is unavailable, contact the computer administrator.

Linux installation

For 64-bit Ubuntu 22.04 or newer and compatible Debian-based distributions.

Download **nfit-0.88.4-linux-x86_64.deb** from the private repository's Releases page.

Graphical installation

- 1 Double-click the downloaded **.deb** file.
- 2 Open it with App Center, Software Install, or your distribution's package manager.
- 3 Click **Install**, enter your system password, and wait for installation to finish.
- 4 Open **nfit** from the application menu.

Terminal installation

Open a terminal in the folder containing the downloaded package and run:

```
sudo apt install ./nfit-0.88.4-linux-x86_64.deb
```

Then launch nfit from the application menu or run:

```
/opt/nfit/nfit
```

Linux dependencies: Using apt installs libc6 2.35 or newer, libgl1, libegl1, libopengl0, libxkbcommon0, and libxcb-cursor0 automatically.

Updates: Installed copies check for newer beta releases after opening. nfit asks before downloading or starting an update and shows download progress.
